# Lab 07: S3 Lambda event integration

Step 1: Create an S3 Bucket

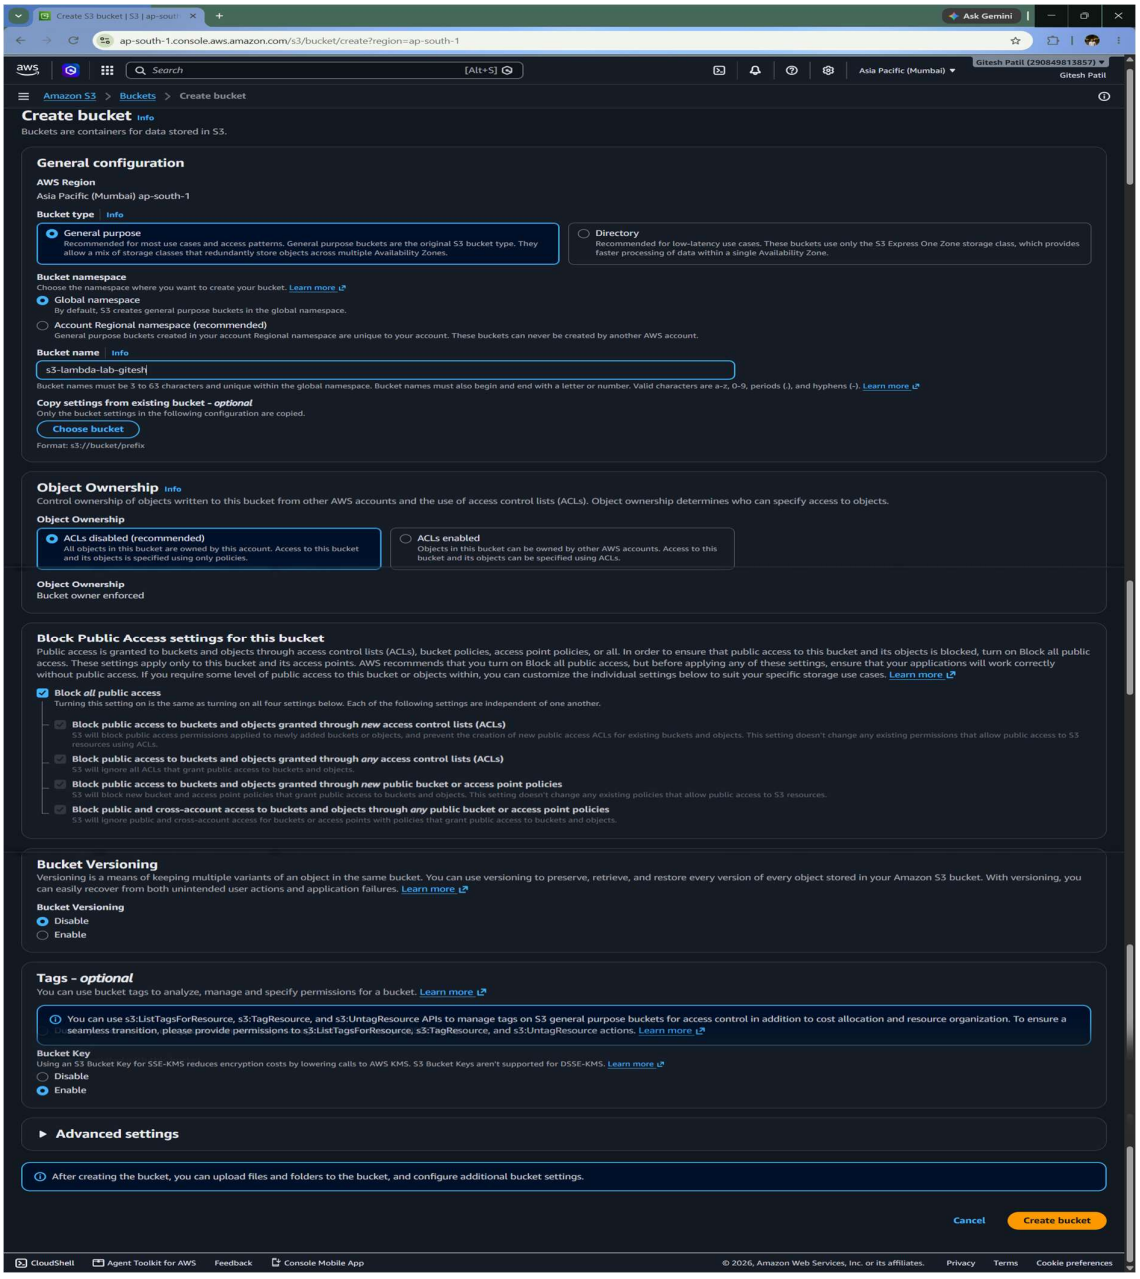

1. Go to AWS Console

2. Click Create bucket

3. Configure:

- Bucket name: s3-lambda-lab-gitesh
- Region: Choose same region you'll use for Lambda

4. then click Create bucket

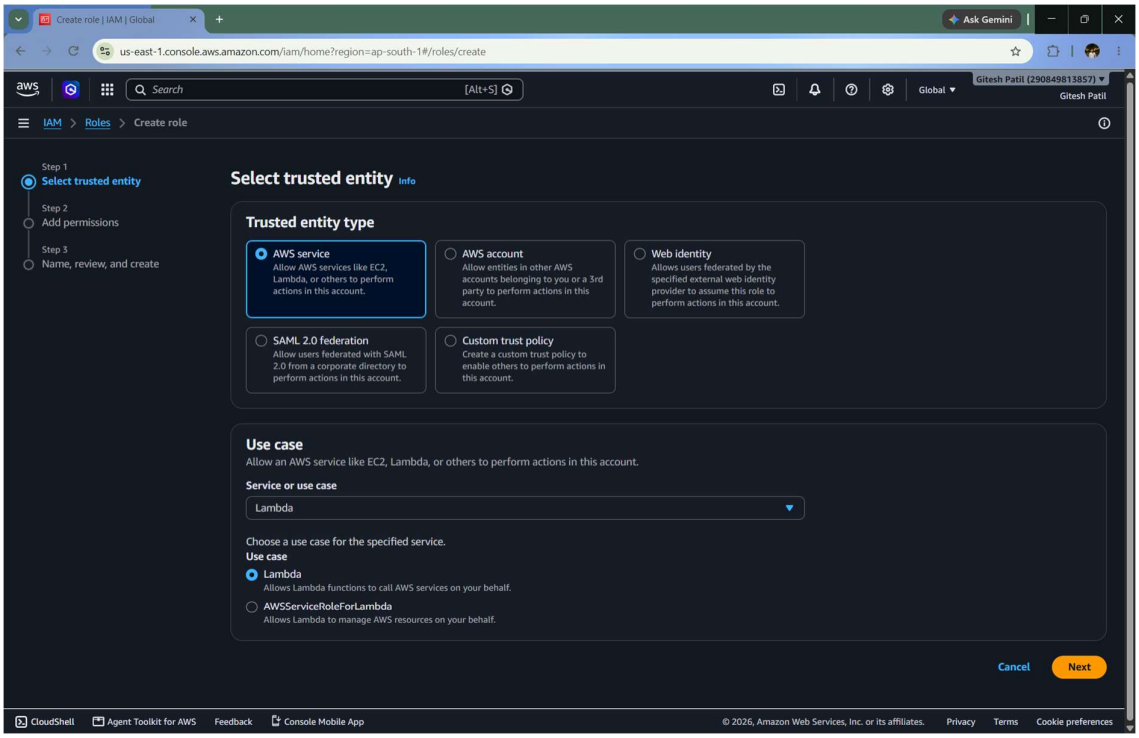

Step 2: Create a Lambda Execution Role

1. Go to IAM -> Roles-> Create role

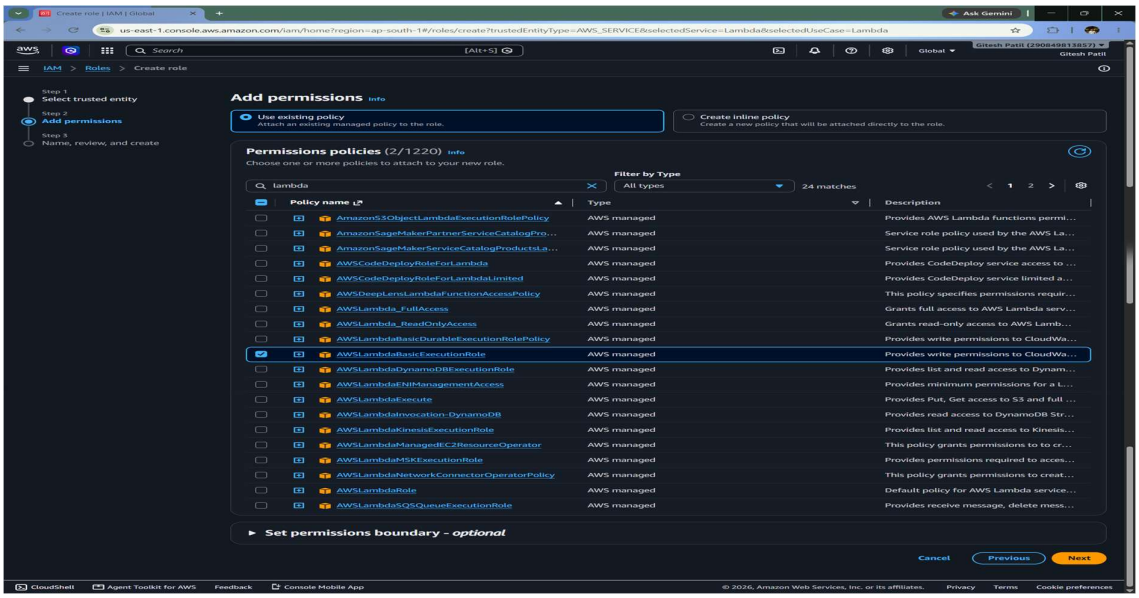

2. Select AWS service Lambda

3. Click Next

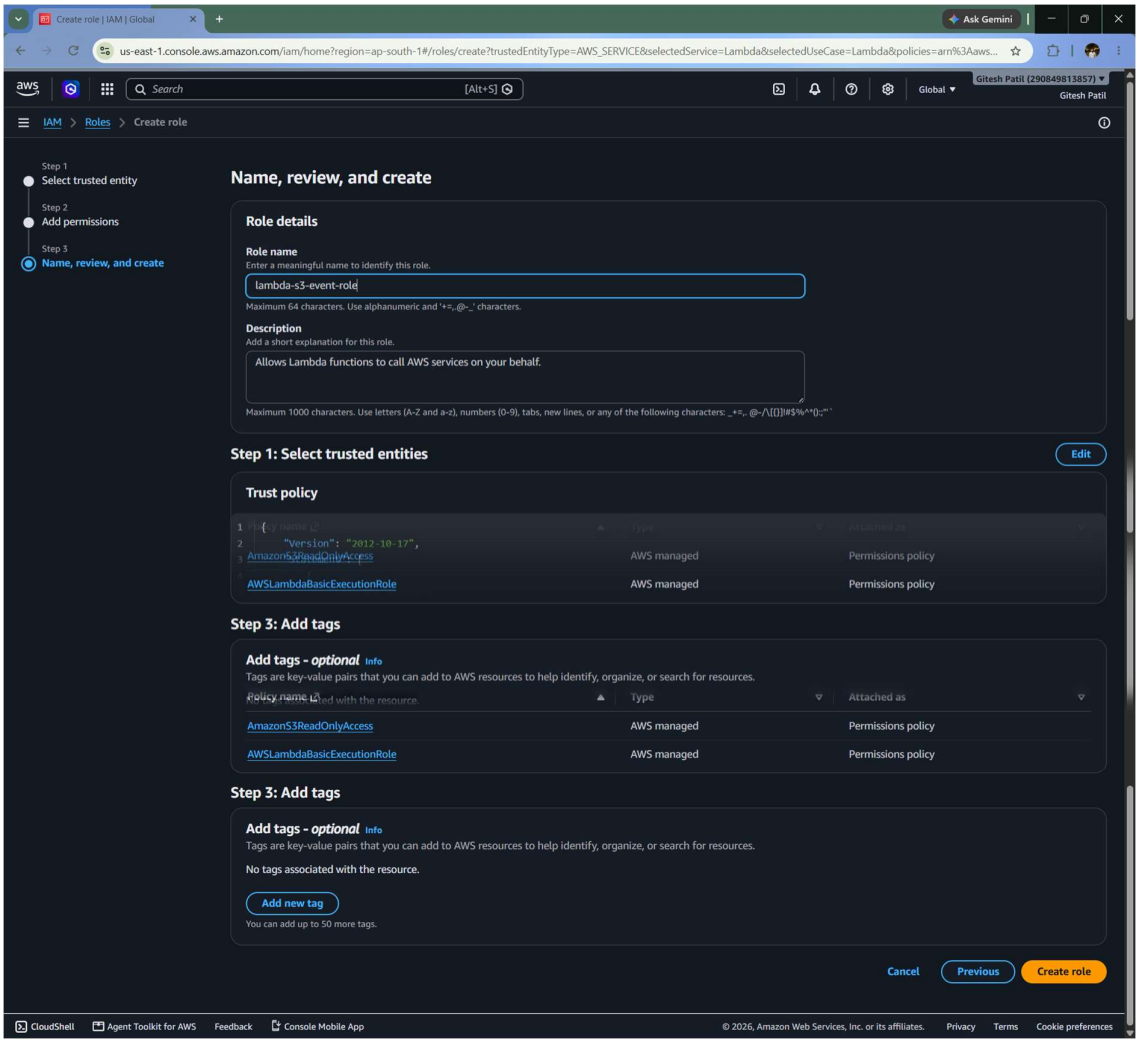

4. Add the following policies:

- AWSLambdaBasicExecutionRole (for CloudWatch Logs)
- AmazonS3ReadOnlyAccess (optional, but useful for testing reading uploads)

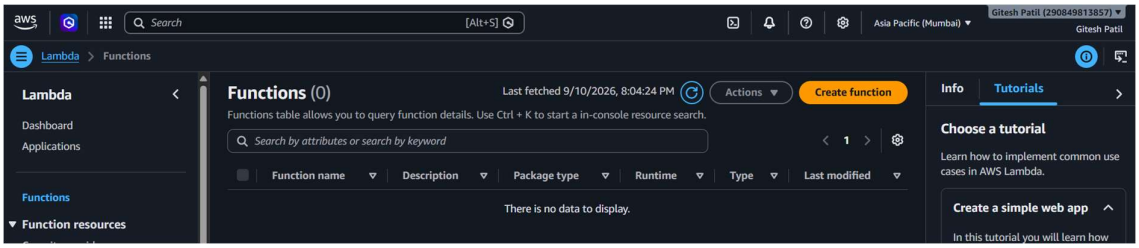

5. Name the role: lambda-s3-event-role

6. Click Create role

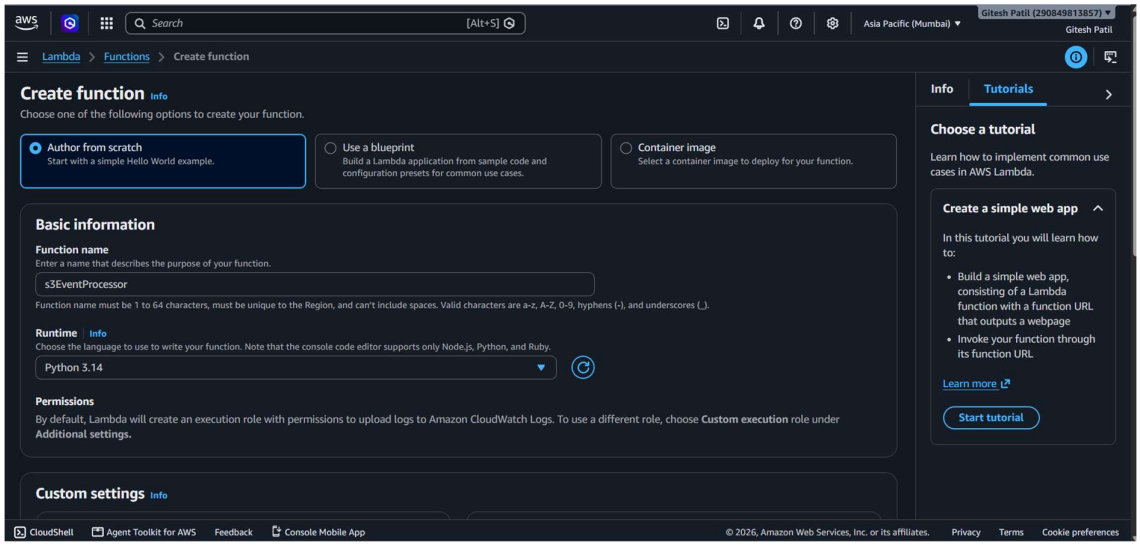

Step 3: Create the Lambda Function

1. Go to AWS Console -> Lambda -> Create function

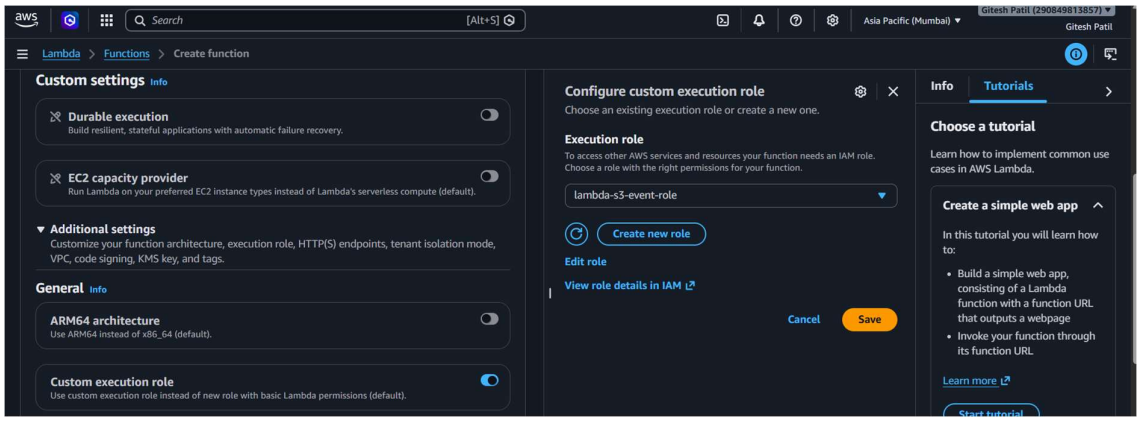

2.Choose Author from scratch

- Function name: s3EventProcessor
- Runtime: Python 3.14

- Execution role: Select lambda-s3-event-role

3.Click Create function

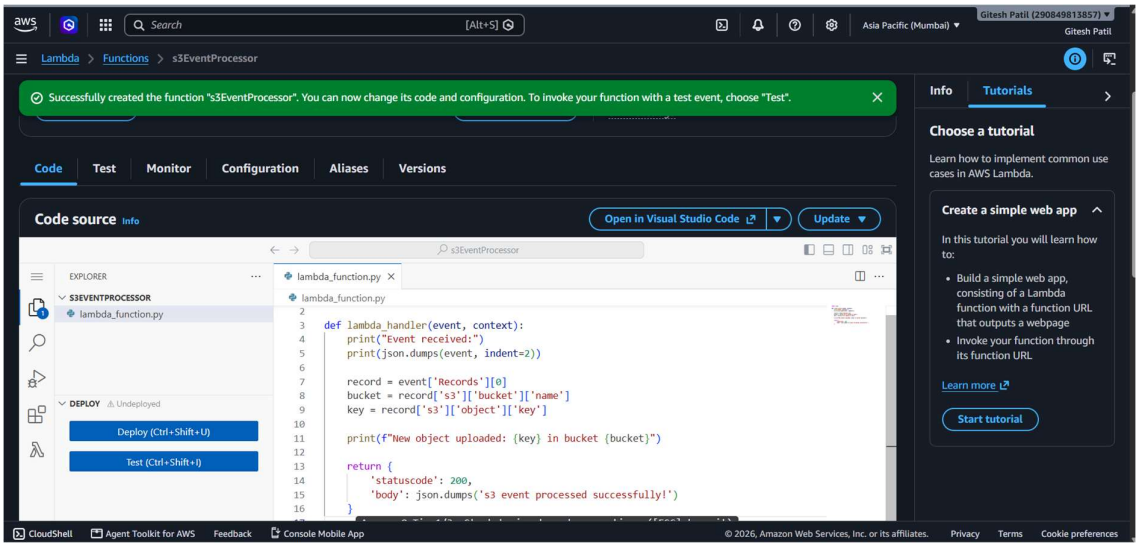

4. Add Sample Lambda Code (Python example)

```
import json
def lambda_handler(event, context):
    print("Event received:")
    print(json.dumps(event, indent=2))

    record = event['Records'][0]
    bucket = record['s3']['bucket']['name']
    key = record['s3']['object']['key']

    print(f"New object uploaded: {key} in bucket
{bucket}")

    return {
        'statusCode': 200,
        'body': json.dumps('S3 event processed
successfully!')
    }
```

5. Click Deploy

Step 4: Add S3 Trigger for the Lambda Function

1. Add the Trigger from the Lambda Console

2. Open your Lambda function

3. Choose Add trigger

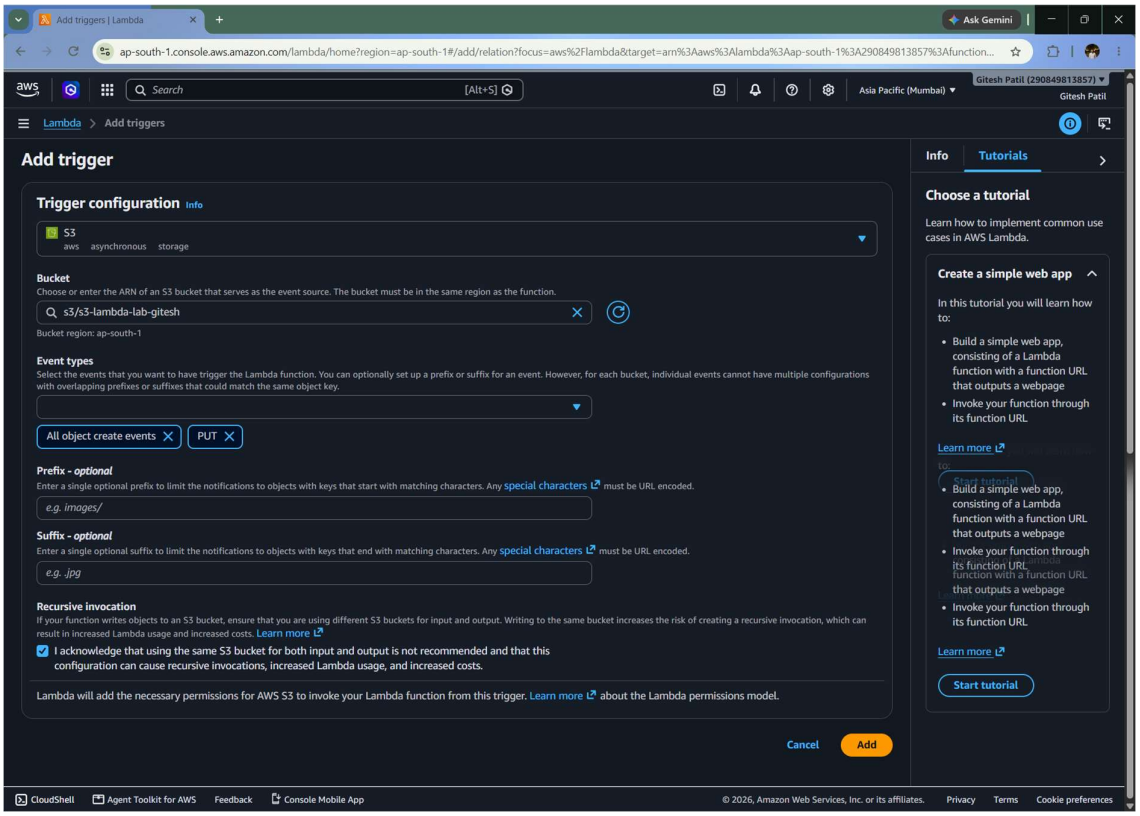

4. Select S3

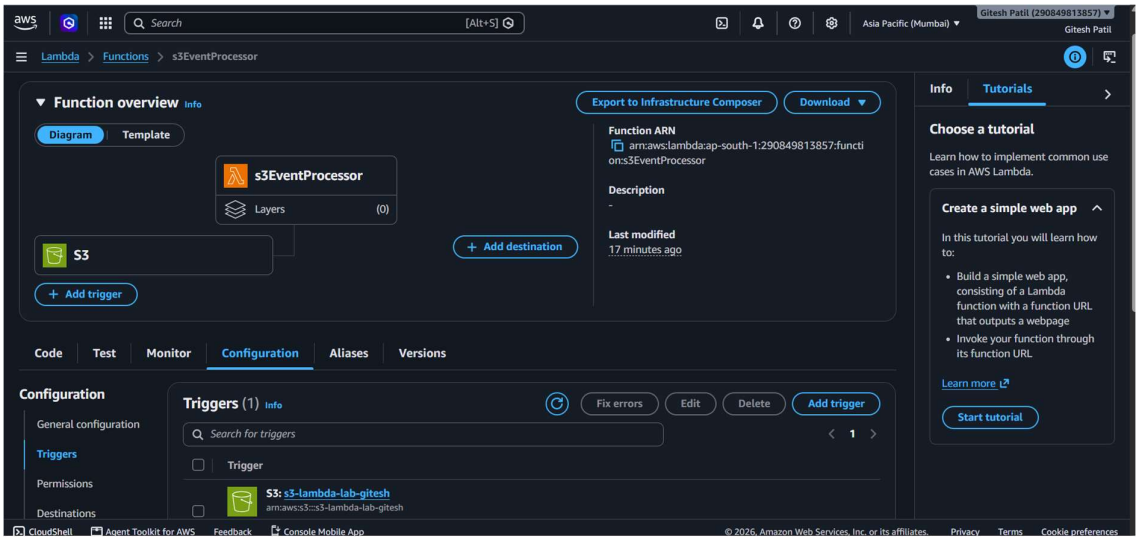

5. Configure:

- Bucket: select bucket created earlier: s3-lambda-lab-dec10
- Event type:PUT Object Created (All)

6. Check "Recursive invocation" if required (usually leave unchecked)

7. Click Add

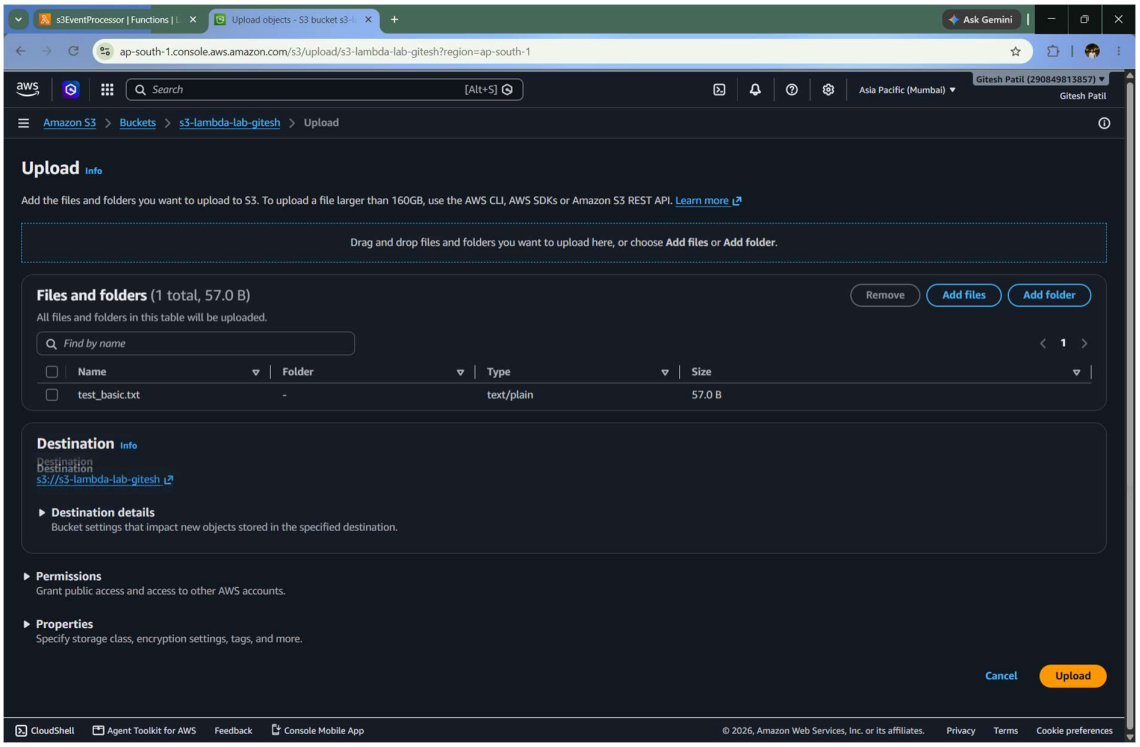

Step 5: Test the S3 * Lambda Integration

1. Go to your S3 bucket - s3-lambda-lab-gitesh

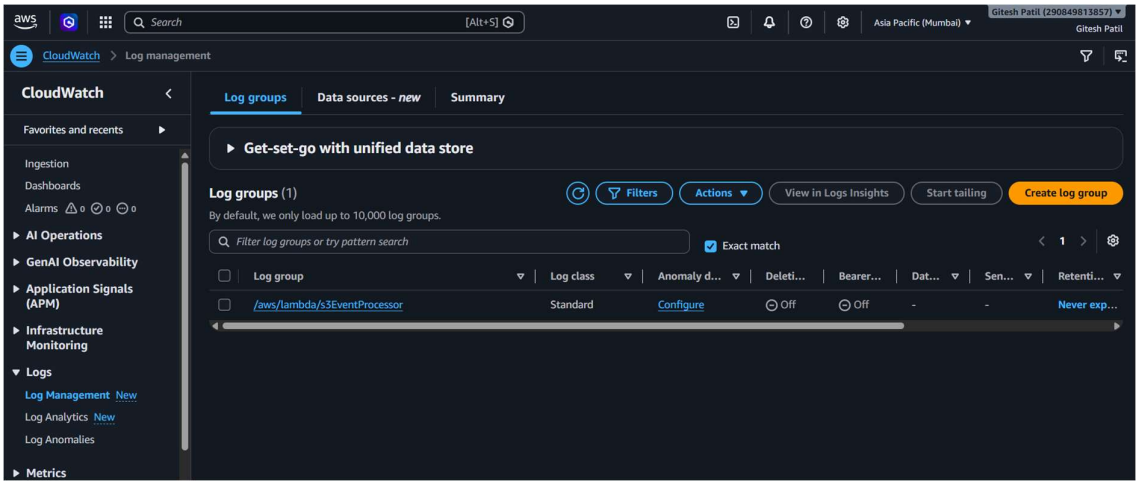

2. Click Upload

3. Select a file (any small test file)

4.Upload the file

5. Go to CloudWatch -> Logs -> Log groups

6. Open /aws/lambda/s3EventProcessor

7. Open the latest log stream

8. You should see the event details printed, something like:
